# LaTeX on Netlify

Francisco Giordano

May 14, 2025

Automatically compile and publish your LaTeX project on Netlify.

Start publishing your document automatically by clicking on the button below. It will clone this repository in your account and set up a Netlify site connected to it.

Deploy to netlify

Edit the `main.tex` file or replace it with your own LaTeX file. Every update to your cloned repository will trigger a republish of the rendered document on Netlify.

Notes The initial setup will take about 3 minutes to download and install a minimal LaTeX environment. All the necessary packages will be downloaded the first time they are seen by `texliveonfly`, without which this project would have been impractical.
